

Lab 6

Akshar Panchani 202101522
CT303 Digital Communication
11/13/23

Experiment -1

CH 1: DATA CLK (266 KHz) & CH 2: SERIAL DATA (00011011)

CH 1: DATA IN & CH 2: NRZ-L & CH 2: NRZ-M

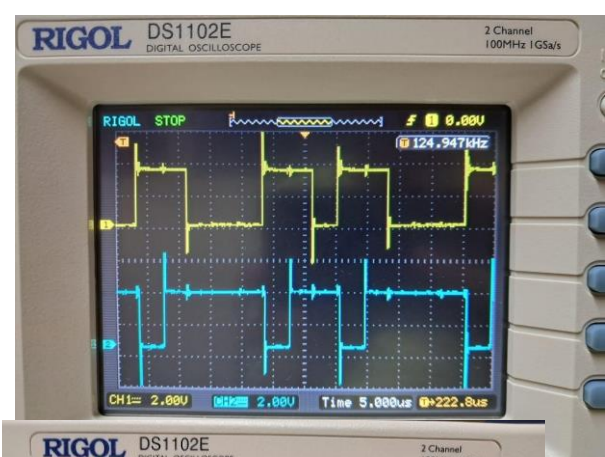

CH 1: DATA IN& CH 2: NRZ-S

CH 1: DATA IN& CH 2: OUT1 & CH 2: OUT2

Question 6.8:

```

N = 10000; % Number of bits
data = 2*randi([0,1], 1, N) - 1; % Generating random data: +1 or -1
h = [0.5, 0.5]; % This is an assumption.
% Variance values
sig_values = [0, 0.1, 0.2, 0.5, 1.0];
for sigma = sig_values
    received_data = filter(h,1,data);
    noisy_received_data = received_data + sigma * randn(1, N);
% Decision Making: Assuming zero threshold. This might need to change based on your actual
channel.
decoded_data = sign(noisy_received_data);
% Calculating error
error = sum(data ~= decoded_data);
err_rate = error/N;
fprintf('Rate of the error in sigma = %f is: %.4f\n', sigma, err_rate);
end;
Rate of the error in sigma = 0.000000 is: 0.5061
Rate of the error in sigma = 0.100000 is: 0.2571
Rate of the error in sigma = 0.200000 is: 0.2497
Rate of the error in sigma = 0.500000 is: 0.2702
Rate of the error in sigma = 1.000000 is: 0.3357

```

Question 6.9

```

h_new = [1, 0.25];
% Using the same data and sigma values from 6.8:
for sig = sig_values
    received_data_new = filter(h_new, 1, data);
    noisy_data_new = received_data_new + sig * randn(1, N);
    decoded_data_new = sign(noisy_data_new);
    err_new = sum(data ~= decoded_data_new);
    err_rate_new = err_new/N;
    fprintf('Rate of Error in sigma = %.4f for new channel = %.4f\n', sig, err_rate_new);
end
Rate of Error in sigma = 0.0000 for new channel = 0.0000
Rate of Error in sigma = 0.1000 for new channel = 0.0000
Rate of Error in sigma = 0.2000 for new channel = 0.0000
Rate of Error in sigma = 0.5000 for new channel = 0.0382
Rate of Error in sigma = 1.0000 for new channel = 0.1657

```
