

LAB 4: TCP and UDP

Akshar Panchani ID- 202101522
IT304 Computer Networks
9/12/23

9/12/23

Exercise:

1.2:

1. Calculate and Observe moving average throughput of both the applications (CBR and VIDEO).

We observe the Throughput for CBR is 0.199600 Mbps and Video is 0.255613 Mbps

Application_metrics <input type="checkbox"/> Detailed View					
Throughput Plot	Application Name	Packet transmitted	Packet received	Throughput (Mbps)	Delay(microsec)
Application throughput plot	APP1_CBR	499	499	0.199600	114.127134
Application throughput plot	APP2_CBR	499	499	0.199600	12226.512102
Application throughput plot	APP3_VIDEO	499	498	0.252925	179.272450
Application throughput plot	APP4_VIDEO	499	499	0.255613	183.780842

Lab- Computer Network

2. Observe the delay and throughput metrics in the simulation window and write down your observation.

Delay is in microseconds as 114.127 for CBR packet and 179.2724 for Video packet.

Queue_Metrics_Table					
Queue_Metrics		<input type="checkbox"/> Detailed View			
Device_id	Port_id	Queued_packet	Dequeued_packet	Dropped_packet	
5	1	500	500	0	
5	2	501	501	0	
5	3	0	0	0	
5	4	0	0	0	
5	5	2000	2000	0	

Calculate throughput:

Here is the attached calculations from the packet trace of the output file.

Here we will notice that the values obtain will be $\gg 0$ rather than to be in the average , this shows that at starting the queue is empty and an easy flow is seen so the values are higher , as the queue will be filled this will start decreasing.

3) Sample calculation for Fix throughput

-> $\text{PAYLOAD} / (\text{APPLICATION LAYER ARRIVAL TIME} - \text{PHYSICAL LAYER END TIME})$

for row 16th -> $566 / (20098.92 - 20000) = 5.72179 \text{ Mbps}$.

Moving Average CBR

Continuous Average

For CBR:

PACKET_ID	PACKET_TYPE	SOURCE_ID	DESTINATION_ID	APP_LAYER_ARRIVAL_TIME(US)	PHY_LAYER_END_TIME(US)	PHY_LAYER_PAYLOAD(Bytes)	Difference	Throughput	Moving average
1	CBR	NODE-1	NODE-6	20000	20098.92	566	98.92	5.72179539	
1	CBR	NODE-2	NODE-6	20000	20105.48	566	105.48	5.36594615	6.871090946

```

1. Select one UDP packet from your trace. From this packet, determine how many fields there are in the UDP header. Name these fields.

There 4 fields observed: Destination and source port with length and checksum

Lab- Computer Network

Wireshark - Packet 14 - Wi-Fi

Frame 14: 62 bytes on wire (496 bits), 62 bytes captured (496 bits) on interface \Device\NPF_{3FC18343-E02A-496D-B4FA-B2EA384B1191}, id 0

Ethernet II, Src: IntelCor_8e:f7:74 (34:cf:f6:8e:f7:74), Dst: Cisco_ee:6a:29 (00:f2:8b:ee:6a:29)

Internet Protocol Version 4, Src: 10.200.17.129, Dst: 165.57.81.142

User Datagram Protocol, Src Port: 51275, Dst Port: 24874

Source Port: 51275

Destination Port: 24874

Length: 28

Checksum: 0x133e [unverified]

[Checksum Status: Unverified]

[Stream index: 0]

[Timestamps]

UDP payload (20 bytes)

Data (20 bytes)

```

0000 00 f2 8b ee 6a 29 34 cf f6 8e f7 74 08 00 45 00  ....j)4-...t..E.
0010 00 30 19 57 00 00 00 11 00 00 0a c8 11 81 a5 39  0.W.....9
0020 51 8e c8 4b 61 2a 00 1c 13 3e 41 00 42 13 01 31  Q-Ka*-->A-B-1
0030 cb 7a 00 00 00 00 00 00 00 00 d1 5e 00 00  ..Z.....^..
  
```

2. By consulting the displayed information in Wireshark's packet content field for this packet, determine the length (in bytes) of the UDP header fields.

From the above screenshot, The UDP header has a length of 8 bytes , where each field is 2 bytes long.

3. The value in the Length field is the length of what? Verify your claim with your captured UDP packet.

Here length observed is 28 and therefore the UDP payload is 28-8 bytes of length i.e 20 bytes.

Wireshark - Packet 14 - Wi-Fi

Frame 14: 62 bytes on wire (496 bits), 62 bytes captured (496 bits) on interface \Device\NPF_{3FC18343-E02A-496D-B4FA-B2EA384B1191}, id 0

Ethernet II, Src: IntelCor_8e:f7:74 (34:cf:f6:8e:f7:74), Dst: Cisco_ee:6a:29 (00:f2:8b:ee:6a:29)

Internet Protocol Version 4, Src: 10.200.17.129, Dst: 165.57.81.142

User Datagram Protocol, Src Port: 51275, Dst Port: 24874

Source Port: 51275

Destination Port: 24874

Length: 28

Checksum: 0x133e [unverified]

[Checksum Status: Unverified]

[Stream index: 0]

[Timestamps]

UDP payload (20 bytes)

Data (20 bytes)

```

0000 00 f2 8b ee 6a 29 34 cf f6 8e f7 74 08 00 45 00  ....j)4-...t..E.
0010 00 30 19 57 00 00 00 11 00 00 0a c8 11 81 a5 39  0.W.....9
0020 51 8e c8 4b 61 2a 00 1c 13 3e 41 00 42 13 01 31  Q-Ka*-->A-B-1
0030 cb 7a 00 00 00 00 00 00 00 00 d1 5e 00 00  ..Z.....^..
  
```

4. What is the maximum number of bytes that can be included in a UDP payload?

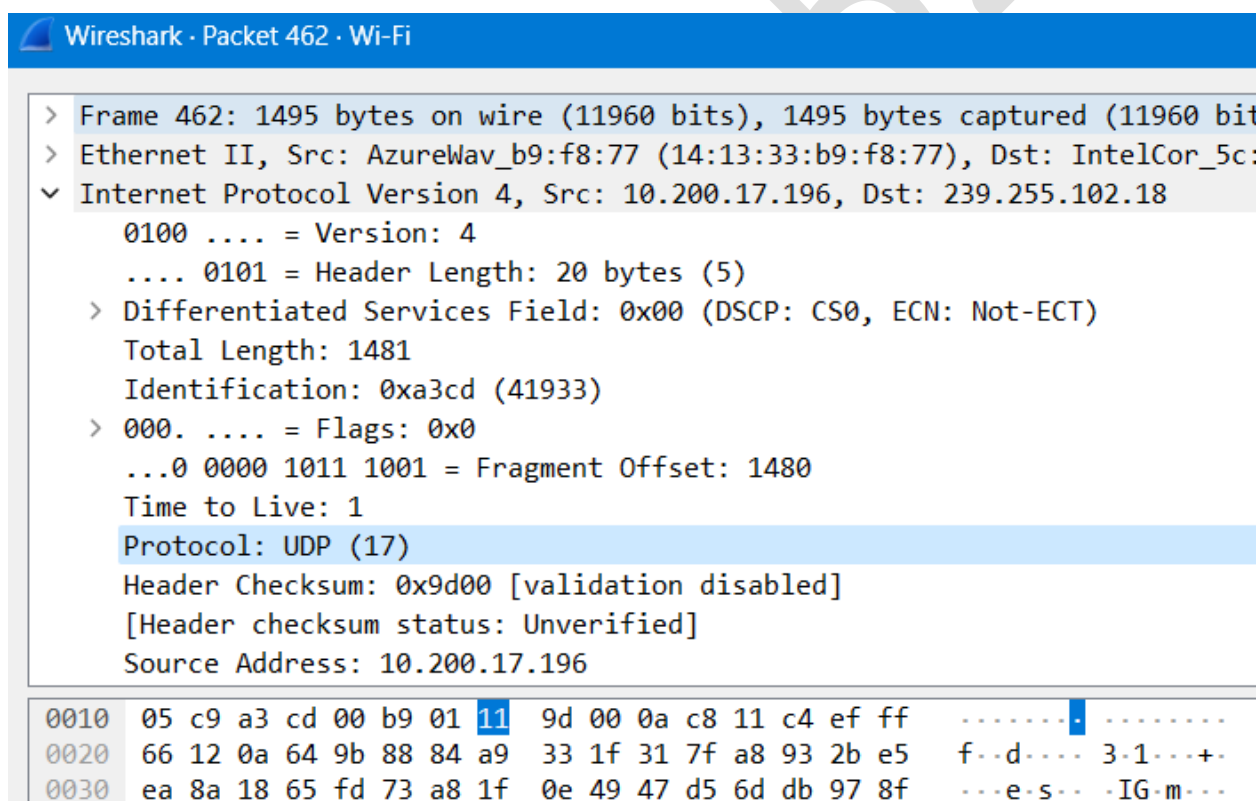

We know that the max no of payload is 2^{16} - the header field bytes which is 65527 -> 65535 - 8 bytes if we consider 1 header file.

5. What is the largest possible source port number?

As mentioned above max payload port number is $2^{16} - 1$ which is 65535.

6. What is the protocol number for UDP? Give your answer in both hexadecimal and decimal notation. To answer this question, you'll need to look into the Protocol field of the IP datagram containing this UDP segment.

Protocol number Decimal number is 17 and hexadecimal is 0x11.

```

Wireshark · Packet 462 · Wi-Fi
> Frame 462: 1495 bytes on wire (11960 bits), 1495 bytes captured (11960 bits) on interface 0
> Ethernet II, Src: AzureWav_b9:f8:77 (14:13:33:b9:f8:77), Dst: IntelCor_5c:14:00:00 (14:00:00:5c:14:00:00)
  > Internet Protocol Version 4, Src: 10.200.17.196, Dst: 239.255.102.18
    0100 .... = Version: 4
    .... 0101 = Header Length: 20 bytes (5)
    > Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)

0030  ea 8a 18 65 fd 73 a8 1f 0e 49 47 d5 6d db 97 8f  ...e.s...IG-m...
  
```

7. Why have we used DNS commands to capture UDP packets? Do you know any-other method to generate UDP traffic using wireshark? Write your answer in detail.

Lab- Computer Network

```
> Internet Protocol Version 4, Src: 10.200.4.38, Dst: 10.100.1.1
✓ User Datagram Protocol, Src Port: 55325, Dst Port: 53
    Source Port: 55325
    Destination Port: 53
    Length: 79
    Checksum: 0x51cd [unverified]
    [Checksum Status: Unverified]
    [Stream index: 6]
    > [Timestamps]
    UDP payload (71 bytes)
> Domain Name System (query)
```

Port number:

Source = 55325

Destination = 53

We would further observe that the sending and receiving port number would come to be same as it connects to UDP.
