## Things not implemented/completed

- The MED.AI website we made is not completely responsive as of now. This was because, the time taken to learn web development was more than expected. The tools and technologies we used were completely new to us and hence took us more time to learn. Also, a few people from our group took up the task of exploring a different genre of work, to learn new skills.
- Another feature we planned on implementing was on adding an account for ‘secretary’ to our website. After creating an account in this domain, you will be able to schedule appointments for the doctor, hence making the work flow smooth and easier. As this was a secondary requirement realised that we need to prioritize more on our primary requirements and need to enhance them more.
- We also had thought on adding an account for the pharmaceuticals to help them access the data on number of medicines prescribed in the past month/year to help them increase their sales. But again, this required more planning than expected. This was because all the personal information of the patients could not be revealed as well as the doctors could prescribe the same medicines with different names, this would create an anomaly in the data. Hence, we kept this thing for future iteration.
