# Dynamic Host Configuration Protocol ( DHCP )

— IT304 COMPUTER NETWORKS —

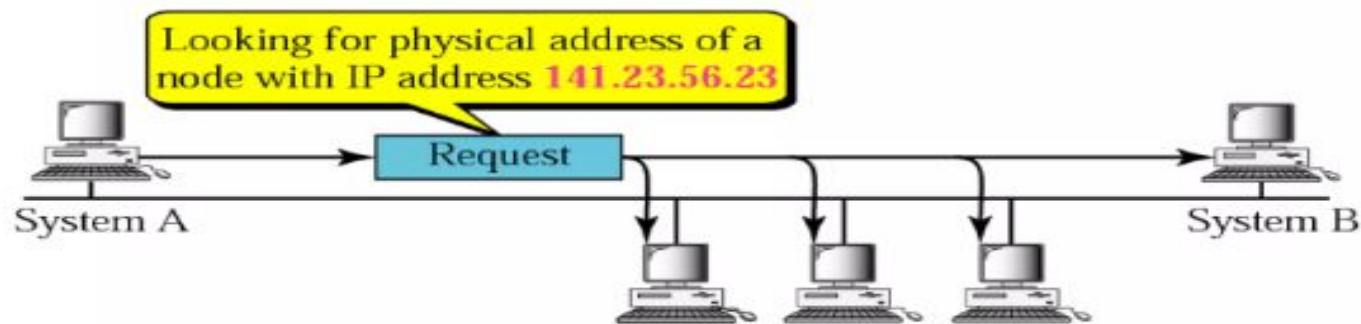

---

# ARP ( Address Resolution Protocol )

## ARP ( Con. )

- ARP associates an **IP address** with its **physical address**. On a typical physical network, such as a LAN, each device on a link is identified by a physical or station address that is usually imprinted on the NIC.
- Logical address to physical address translation can be done statically (not practical) or dynamically (with ARP).

a. ARP request is broadcast

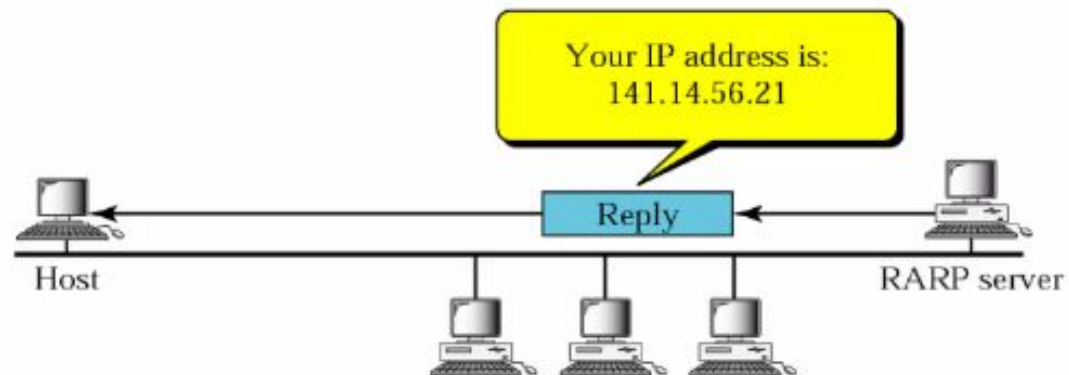

b. ARP reply is unicast

# RARP ( Reverse ARP )

- RARP finds the logical address for a machine that only knows its physical address.
- This is often encountered on thin-client workstations. No disk, so when machine is booted, it needs to know its IP address (don't want to burn the IP address into the ROM).
- RARP requests are broadcast, RARP replies are unicast.

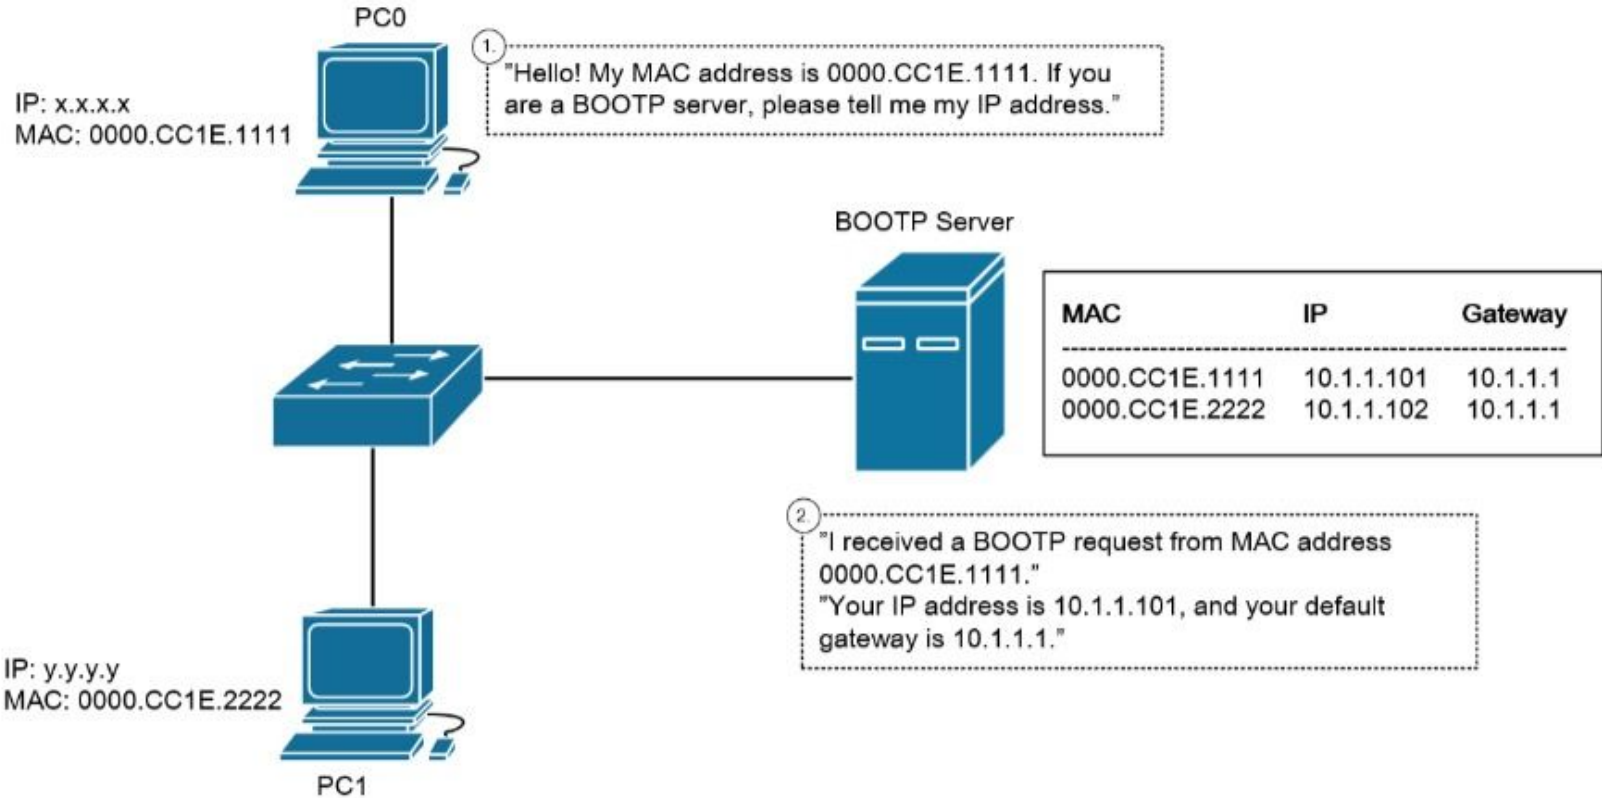

a. RARP request is broadcast

b. RARP reply is unicast

# BootP ( Bootstrap Protocol )

- BOOTP (Bootstrap Protocol) is an internet protocol that lets a network user automatically be configured to receive an IP address and have an operating system booted without user involvement.
- The BOOTP server, managed by a network administrator, automatically assigns the IP address from a pool of addresses for a certain duration of time.
- Today, BOOTP is executed using User Datagram Protocol (UDP) and is the basis for Dynamic Host Configuration Protocol (DHCP).

# DHCP ( Dynamic Host Configuration Protocol )

- DHCP Stands for Dynamic Host Configuration Protocol
- DHCP is a protocol that automatically provides an IP host with its IP address and other related configuration information ( subnet mask default gateway DNS etc.)
- Works on Protocol UDP port no 67 and 68.

# Static IP

## DHCP

IP Address = 10.0.0.2

A **static** IP is where a user assigns an I.P. address manually.

# Dynamic IP

## DHCP

A diagram showing a rack of network equipment on the left. One of the units in the rack is labeled 'DHCP SERVER' and has a green light. A blue line connects this unit to a computer monitor on the right. Below the monitor, the text 'IP Address =' is followed by a white rectangular input box.

IP Address =

A **dynamic** IP is where a computer gets an I.P. address from a DHCP server.

A DHCP server automatically assigns a computer an:

- I.P. address
- Subnet mask
- Default gateway
- DNS server

# Dynamic IP

## DHCP

IP Address = 10.0.0.2

Command Prompt

Microsoft Windows

C:\Users\Admin> Ipconfig /all

DHCP Enabled	.....	Yes
IPv4 Address	.....	10.0.0.2
Subnet Mask	.....	255.255.255.0
Default Gateway	.....	10.0.0.1
DNS Server	.....	10.0.0.9
Lease Obtained	.....	Sunday, April 25, 20
Lease Expires	.....	Sunday, April 26, 20

# Reservation of IP in DHCP

## DHCP

### DHCP SETTINGS

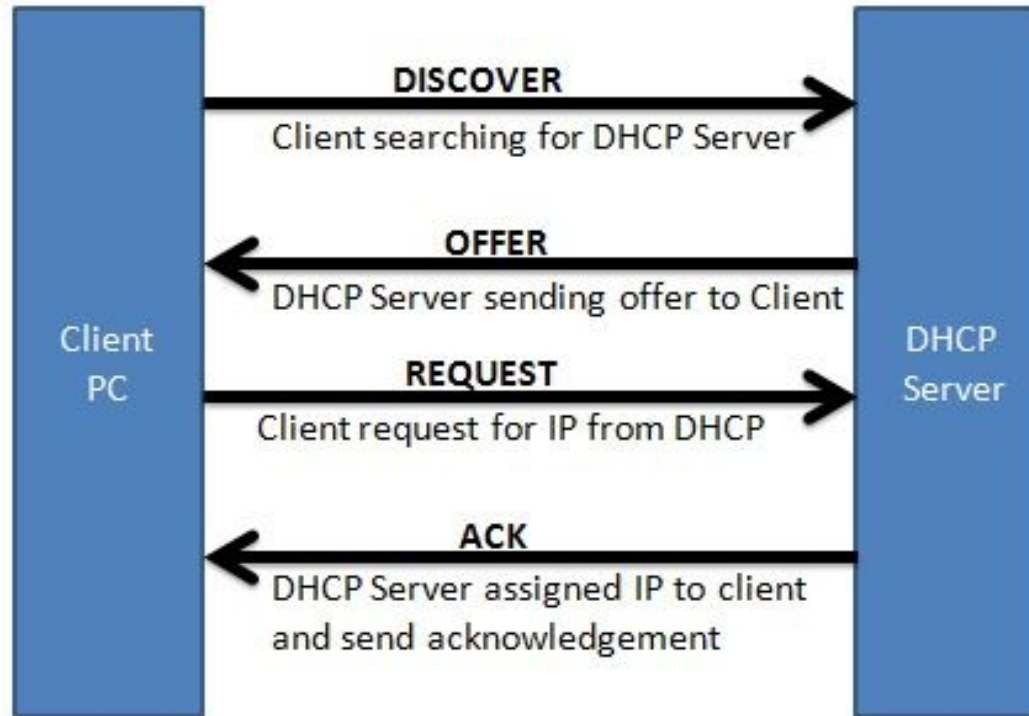

#### ADDRESS RESERVATION

IP Address	Device Name	MAC Address
10.0.0.1	MY-PC	00:17:30:46:72:04

A **reservation** ensures that a specific computer or device will always be given the same I.P. address.

# DHCP Working Flow

# DHCP Message Types

DHCP Message	Use
DHCPDISCOVER	Client broadcast to locate available servers
DHCPOFFER	Server to client response offering configuration parameters
DHCPREQUEST	Client broadcast requesting offered parameters
DHCPDECLINE	Client to server notification that IP address is in use
DHCPACK	Server to client response confirming a request
DHCPNAK	Server to client response denying a request
DHCPRELEASE	Client to server request to relinquish IP address
DHCPINFORM	Client to server request for configuration parameters

# DHCP Client Table

Client Name	Interface	IP Address	MAC Address	Expires Time
WirelessComp-02	Wireless	192.168.1.117	68:09:27:38:D1:67	23:11:26
WirelessComp-01	Wireless	192.168.1.149	C0:C1:C0:5B:8E:63	19:26:17
Computer-02	LAN	192.168.1.143	E0:69:95:C7:0C:75	19:54:28

# Advantages of DHCP

- To implement DHCP requires no additional costs.
- Duplicated IP addresses are prevented.
- Reduces the amount of time you spend configuring computers on your network.
- DHCP servers only allocate IP addresses to clients when they request them.

# Questions :

(1) What service is DHCP an extension of?

- A. TFTP
- B. BOOTP
- C. RARP
- D. DNS

(2) What is the function of ARP?

- A. Find the hardware address of destination.
- B. Find the IP address of destination.
- C. Find the hardware address of source.
- D. Find the IP address of source.

# Questions :

**(3) What happens to the IP address if the client has not received an extension?**

- A. DHCP OFFER is sent**
- B. DHCP NAK is sent from the server**
- C. The client drops the IP**
- D. DHCP DISCOVER is sent from the server**

**(4) What is used for the first 24 bits of a hardware address?**

- A. IP address**
- B. Vendor Code**
- C. Serial number**
- D. Network portion**

# Questions :

**(5) Who controls/configures DHCP servers?**

- A. Router software**
- B. Network administrators**
- C. Clients through DHCP options**
- D. Microsoft personnel**

**(6) What is DHCP?**

- A. Creates IP pools to conserve address**
- B. Used to configure PCs over the network**
- C. Assigns configuration info dynamically**
- D. All of the above**
