Since acceleration has the dimensions of length per time squared, the dimensions of force are

Time<sup>2</sup>

or in dimensional symbols

Force = 
$$\frac{ML}{T^2}$$

Such dimensional analysis is also useful for determining the dimensions of a quantity. The wavelength  $(\lambda)$  and frequency (f) are related to the velocity as

$$v = f\lambda \tag{1.1}$$

The velocity of light  $c = 3 \times 10^8$  m/s

In free space  $v = c = 3 \times 10^8 \text{ m/s}$ 

Equation (1.1) can be confirmed by using the chart of Table 1.2.

TABLE 1.2 Frequencies and wavelengths of the electromagnetic spectrum

|  | Frequency             | f = c/  | Wavelength = $c/f$    | Relevant dimensions   |

# THE ELECTROMAGNETIC SPECTRUM

According to an American military general, the third World War (if ever fought) will be won by the side that will have a better command over the electromagnetic spectrum (given in Table 1.2). Theoretically, the spectrum encompasses all frequencies ranging from 0+ to infinity. The spectrum shown, however, includes a limited (finite) range along with relevant known objects to fit into the human imagination.

LO5 Discuss electromagnetic spectrum and the radio frequency bands

#### Radio Frequency Bands 1.5.1

Besides, the sphere of present-day communication involving antennas is confined to still a limited segment of the spectrum. The frequencies of SHF segment are further divided into a number of bands and subbands in Table 1.3. This table also includes the principal applications corresponding to different bands.

TABLE 1.3 Radio frequency, band designation and principal applications

## Review

### SUMMARY

## LO 1: Explain the evolution of antennas

- Antennas are electronic eyes and ears of the world and are essential for aircraft, ships, space vehicles, cellular phones and all types of wireless devices.
- First radio antennas were built by a German professor, Heinrich Hertz, in 1886.
- Marconi's invention at the beginning of twentieth century made him the Wizard of Wireless.

### LO 2: Define the units and dimensions

A dimension defines a physical characteristic of an object.
